Print-Ready File Formats

The following is a list of common file formats we accept, though .pdf is the preferred format:

Raster: .psd, .jpg, .tif & .pdf

Vector: .ai, .indd, .eps & .pdf

Turn Overprint off when preparing your file (varies by application).

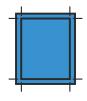

PMS

If a PMS number is provided, most colors can be represented fairly closely. However, certain colors are impossible to represent exactly; some PMS colors are out of gamut for digital CMYK printing.

Bleed

In order to ensure ink coverage is edge to edge on your print, we ask that you send your files with bleed. For instance, if a $24'' \times 36''$ banner needs 1'' of bleed, your file would be $26'' \times 38''$.

Resolution

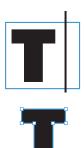

- **BILLBOARD RESOLUTION** Raster files should be 50ppi at full size
- **ANY OTHER PRINT** Raster files should be 72ppi - 200ppi at full size

PPI = Pixels per inch - the number of pixels per inch in screen/scanner file terms

Outline Fonts

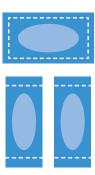

When you add text to your file it is important that you "Outline" the text (sometimes called "Convert to Path") before you send it to be printed. If the text isn't outlined. font substitution may occur when we open the file. Sending fonts with your files is acceptable, but not ideal; there are many variations of a single font, and unless the font is exactly the same font in the document, we may not be able to apply the font correctly.

PREPRESS

Pockets, Hems & Welds

Extra material at the edge of the print is turned over and stitched or welded depending on the specifications of the project. It is important that nothing crucial (like text and logos) falls in the pocket area. Think of pockets like "margins."

What is a Pocket?

A pocket is an over-sized hem. It provides an opening to slide a pole through for a variety of applications.

Outer Diameter of Pole	Pocket Opening
Up to 0.75"	2"
Up to 1.25"	3"
Up to 1.75"	4"
Up to 2.75"	5.5"
Up to 3.75"	7"

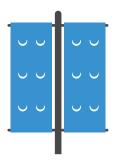

Cut Paths

If your project is cut to shape, we ask that you supply us with a cut path. A cut path is a vector shape that allows our cutter to read and match up with registration marks. A simple one pixel stroke on the shape is needed, and preferably placed on a separate layer named "Cut Path."

Windslits

Windslits allow air to pass through the banner, preventing damage to the banner. As many or as few windslits as desired can be added, but is recommended that windslits are spaced around 10" apart from each other and at least 4" from the edge of the banner. When building your file, we need the windslits to be a 4"w x 2"h half circle with a 1px stroke on a seperate layer.

PREPRESS

Double Sided Signs

A double sided sign with a directional arrow requires a different image to be provided for both sides.

When arrows face the same direction on the frontside file and the backside file (or the same image on both sides), then when they are printed together double sided, the arrows will be pointing in opposite directions.

However, when arrows face in opposite directions on the frontside file and the backside file, then when they are printed together double sided, the arrows will both be pointing the correct direction.

CORRECT

First & Second Surface Decals

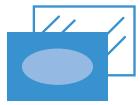

First Surface refers to the front, exterior viewing surface of a substrate. This can be anything from a glass window in a storefront to clear Polycarb for a backlit sign. The printer produces your graphic right reading directly on the first surface of your substrate, or on the vinyl to be applied to the substrate: when viewed from outside, the print is seen directly rather than through the substrate.

There may be differences in how first surface is used depending on the product you have chosen and the application of the product.

Second Surface refers to the interior surface of a substrate. Artwork with second surface application will be reverse-printed, or mirrored, so that it can be viewed correctly from the outside, through the substrate, once installed.

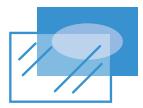

Products that utilize second surface application have the benefit of the clear substrate protecting the image from fading, chemicals and/or abrasion.

FIRST SURFACE

Adhesive on back side of print.

SECOND SURFACE

Adhesive on front side of print.

PREPRESS

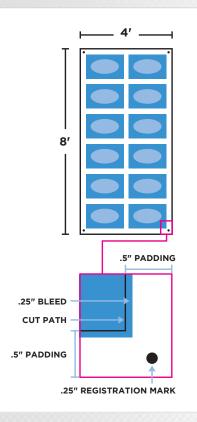

File Setup and Material Size

Our cutting systems cut out a printed product precisely using registration marks that are printed on the material along with the art, which then match up to a cut file in our cutting software.

These registration marks are detected by a camera and used to triangulate the coordinates of a cut path in the cut file. To allow room for these marks to be printed along with the art, there must be a border of free space around the art.

This border, or padding, reduces the amount of available print space on the material when a cut path is required. The default size from the edge of the cut path to the edge of the material is .5".

However, if a cut path is not required, we are able to print full sheets edge-to-edge.
